Summary

Full-Stack Software Engineer specializing in **telecom** and **financial-technology domains**, with hands-on experience building **enterprise-grade budgeting, forecasting, and order-management systems** using **Spring Boot, React, and Microservices architecture**. Currently engineering a **U.S. government financial planning platform** processing large-scale, multi-year budget datasets, with additional exposure to **telecom OSS/BSS platforms (Oracle MetaSolv/M6)**. Skilled in **secure REST APIs, cloud-native deployment, and AI-driven application development**.

Skills

Languages: Java, Python, SQL, JavaScript, TypeScript

Backend: Spring Boot, Spring Security, Hibernate, Microservices

Frontend: React, Angular

Databases: MySQL, Oracle DB

Other: AWS, Docker, Kafka, Jenkins

AI Tools: GitHub Copilot, Claude Code, Antigravity, Cursor

Work Experience

Application Engineer, Covalience

June 2024 – Present

Working on a U.S. government financial planning platform handling multi-year budget forecasting and large-scale financial datasets.

- Built and maintained scalable backend services using **Java, Spring Boot, and Microservices architecture**, deployed on **AWS** with load-balanced infrastructure to ensure high availability for financial workflows.
- Containerized applications using **Docker** and deployed on **Kubernetes**, reducing environment inconsistencies and enabling smoother scaling across production systems.
- Improved platform performance by integrating **Hazelcast distributed caching**, reducing database load and response times for high-volume financial data queries.
- Automated key operational workflows through custom **Bash scripting**, streamlining deployment pipelines and reducing manual engineering effort.

Projects

Telecom Order Management & Provisioning — Oracle MetaSolv (M6)

- Worked on **order management and provisioning workflows** using **Oracle MetaSolv (M6)**, supporting end-to-end telecom order lifecycle processing.
- Implemented asynchronous message processing using **Message-Driven Beans (MDB)** on **JMS**, enabling reliable, decoupled handling of order and provisioning events.
- Used **Apache Kafka** for event-driven communication between order and provisioning systems, supporting real-time order status updates.
- Designed and queried **Oracle Database** schemas to manage order, inventory, and customer/account data with data integrity across provisioning workflows.
- Leveraged **Splunk** for production monitoring and log analysis, proactively identifying and debugging failed transactions to reduce order-processing downtime.

Education

Chitkara University, B.E. in Computer Science

2021-2025

- CGPA: 9.39

Certifications

- **Google Generative AI** — Google Certificate Link
- **Introduction to Cloud Computing** — Coursera Certificate Link
